

## New BAHMÜLLER Multi Double Champion at Sarow Kartonagen

Manfred Sarow is enthusiastic about how productively XXL boxes can be produced on his new line. Stitching, gluing and taping with the servo driven TopSpeedTaper. Gluing is possible in combination – cold and hot melt. A real innovation for semi-automatic lines.

BAHMÜLLER has been well known for semi-automatic sealing lines for many years.

With the new generation of multi sealing lines, the servo drive technology as well as latest safety standards have been implemented.

Further advantages are the faster setup times due to a new HDMI, the remote control for trouble shooting and a better accessibility.

The fully servo driven stitching heads offer flexible stitching patterns with a detection system and a higher process stability. Thanks to the reduction of mechanical parts, maintenance costs could be reduced as well.

With our combination gluing system, all sealing methods are possible: PVA glue, hot melt glue and a combination with stitching and taping.

The perfect solution for sheet plants up to integrated companies - from the table stitcher up to a multi sealing line for a production from stack to stack. Board qualities up to heaviest triple wall can be converted on the line.
